

## Lecture 8. SLAM with known correspondences

Gonzalo Ferrer

14 February 2023

### 1 Simultaneous Localization ( $x_t$ ) and Mapping ( $m$ )

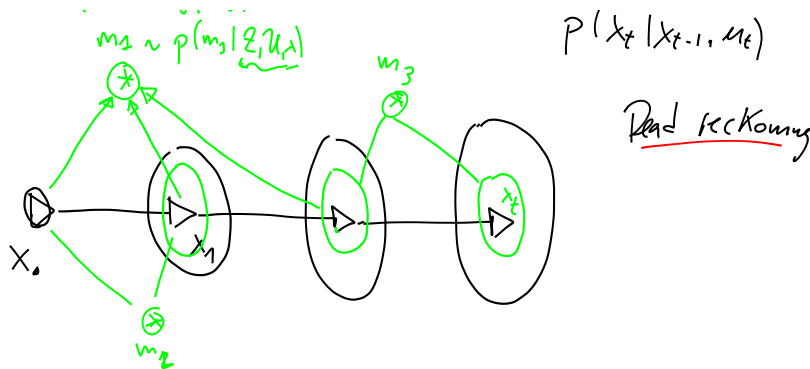

Figure 1: SLAM scheme. Open loop calculation of positions (dead reckoning) results in high uncertain state estimates (black ellipsoids). By taking into account landmark observation, we can reduce the uncertainty on the trajectory estimation (green ellipsoids).

Given :  $u_{1:t} = \{u_1, u_2, \dots, u_t\}$

actions

$z_{1:t} = \{z_1, z_2, \dots, z_t\}$

obs (L05),  $z = \begin{bmatrix} r \\ \phi \\ s \end{bmatrix}$

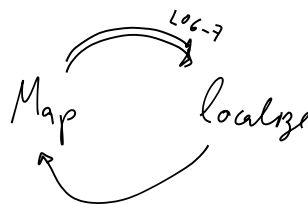

Calculate :  $x_{0:t} = \{x_0, x_1, x_2, \dots, x_t\}$

trajectory

$m = \left\{ \begin{bmatrix} m_{1,x} \\ m_{1,y} \end{bmatrix}, \begin{bmatrix} m_{2,x} \\ m_{2,y} \end{bmatrix}, \dots, \begin{bmatrix} m_{J,x} \\ m_{J,y} \end{bmatrix} \right\}$

map of landmarks

- The association landmark-observation is not always known
- Incorrect DA can ruin the map

The chicken and the egg problem!

Initial approach: Use KF with known correspondences. Next lecture 9 we will cover the DA problem.

## 2 EKF SLAM with known correspondences

$$p(x_t, m | z_{1:t}, u_{1:t}, c_t)$$

where correspondences  $c_t$  denote the pair landmark  $m_j$  and observation  $z^i$  such that  $\{c_t^i = j\} = c_t$ .

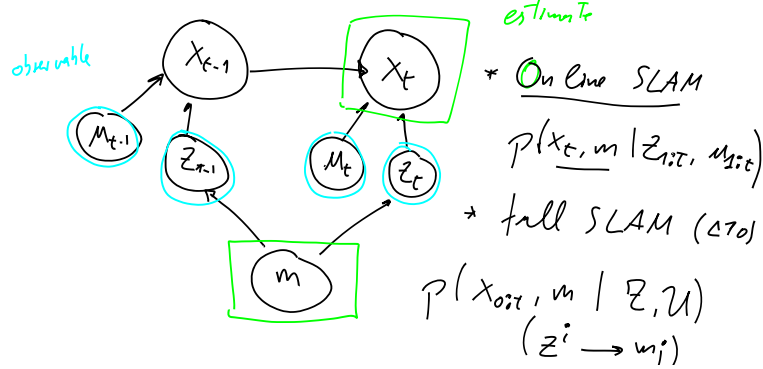

Figure 2: Bayes Network representing the SLAM problem. Variables to estimate are  $x$  and  $m$ .

Augmented state:

$$\begin{aligned} y_t &= [x_t \quad m_1 \quad m_2 \quad \dots \quad m_N]^T \\ &= \left[ \underbrace{x \quad y \quad \theta}_{\text{2D Pose}} \quad \underbrace{m_{1,x} \quad m_{1,y}}_{\text{landmark positions}} \quad \dots \quad m_{N,x} \quad m_{N,y} \right]^T \\ y_t &\sim \mathcal{N}(\mu_t, \Sigma_t) = \mathcal{N} \left( \begin{bmatrix} \mu_t^x \\ \mu_t^m \end{bmatrix}, \begin{bmatrix} \Sigma_x & \Sigma_{x,m} \\ \Sigma_{m,x} & \Sigma_m \end{bmatrix} \right) \\ &\quad \left( \begin{array}{c|c} \Sigma_x & \Sigma_{x,m} \\ \hline \Sigma_{m,x} & \Sigma_m \end{array} \right)_{(2N+3) \times (2N+3)} \end{aligned}$$

---

### Algorithm 1 EKF (L07) SLAM (ProbRob 314)

---

- 1:  $\bar{\mu}_t = g(\mu_{t-1}, u_t)$  ▷ Prediction
  - 2:  $\bar{\Sigma}_t = G_t \Sigma_{t-1} G_t^T + R_t$
  - 3:  $K_t = \bar{\Sigma}_t H_t^T (H_t \bar{\Sigma}_t H_t^T + Q)^{-1}$  ▷ Multiple observations can be corrected
  - 4:  $\mu_t = \bar{\mu}_t + K_t(z_t - h(\bar{\mu}_t))$  ▷ Sequential vs Batch
  - 5:  $\Sigma_t = (I - K_t H_t) \bar{\Sigma}_t$
- 

### 2.1 Prediction

$$y_t = [x \quad m_1 \quad m_2 \quad \dots \quad m_N]^T$$

$g(y_{t-1}, u_t) \rightarrow$  transition function (Odometry model (PS3), Kinematic model (ProbRob), etc.

$$g(y_{t-1}, u_t) = \begin{bmatrix} g_x(x_{t-1}, u_t) \\ m_1 \\ m_2 \\ \vdots \\ m_N \end{bmatrix}_{3+2N} + \varepsilon_t = (\text{odometry model e.g.})$$

$$= y_{t-1} + \begin{bmatrix} \delta_{tr} \cdot \cos(\theta_{t-1} + \delta_{rot1}) \\ \delta_{tr} \cdot \sin(\theta_{t-1} + \delta_{rot1}) \\ \delta_{rot1} + \delta_{rot2} \\ 0 \\ \vdots \\ 0 \end{bmatrix}$$

I.  $\bar{\mu}_t = g(\mu_{t-1}, u_t)$   
 II.  $\bar{\Sigma}_t = G_t \Sigma_{t-1} G_t^T + R_t$

$$G_t = \frac{\partial g(y_{t-1}, u_t)}{\partial y_{t-1}} \Big|_{\mu_{t-1}} = \begin{bmatrix} \frac{\partial g_x}{\partial x} & \frac{\partial g_x}{\partial m_1} & \dots & \frac{\partial g_x}{\partial m_N} \\ \frac{\partial m_1}{\partial x} & \frac{\partial m_1}{\partial m_1} & \dots & \frac{\partial m_1}{\partial m_N} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial m_N}{\partial x} & \frac{\partial m_N}{\partial m_1} & \dots & \frac{\partial m_N}{\partial m_N} \end{bmatrix} = \begin{bmatrix} G_{t3 \times 3}^x & 0 & \dots & 0 \\ 0 & I_{2 \times 2} & \dots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & \dots & I \end{bmatrix}$$

$$= \begin{bmatrix} G_t^x & 0 \\ 0 & I_{2N \times 2N} \end{bmatrix}$$

$$R_t = \begin{bmatrix} R_t^x & 0 \\ 0 & 0_{2N \times 2N} \end{bmatrix} = \begin{bmatrix} V_t^x M_t^x (V_t^x)^T & 0 \\ 0 & 0 \end{bmatrix}$$

Robot noise in state space or action space. Landmark do not propagate  $\Rightarrow$  no noise!

state space	action state
$g(y_{t-1}, u_t) + \varepsilon_t$	$g(y_{t-1}, u_t + \varepsilon'_t)$
$\varepsilon_t \sim \mathcal{N}(0, R_t^x)$	$\varepsilon'_t \sim \mathcal{N}(0, M_t^x)$

The block matrix  $\Sigma_m$  remains unaltered from time  $t-1$  and  $t$  in the propagation.

Recall covariance for noise on transition in the action space:

$$M_t^x = \begin{bmatrix} \alpha_1 \delta_{rot1}^2 + \alpha_2 \delta_{tr}^2 & 0 & 0 \\ 0 & \alpha_3 \delta_{tr}^2 + \alpha_4 (\delta_{rot1}^2 + \delta_{rot2}^2) & 0 \\ 0 & 0 & \alpha_1 \delta_{rot2}^2 + \alpha_2 \delta_{tr}^2 \end{bmatrix}$$

## 2.2 Correction: adding new landmarks

Data association:  $\{c_t^i = j \Rightarrow z_i \rightarrow m_j\}$

New landmark is observed. We must initialize it.

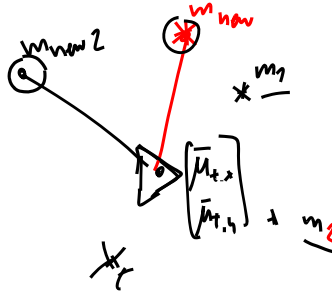

$$z_t = h(y_t, j) + \eta_t = (\text{L06 2D model})$$

$$= \begin{bmatrix} \sqrt{(m_{j,x} - x)^2 + (m_{j,y} - y)^2} \\ \text{atan2}(m_{j,y} - y, m_{j,x} - x) - \theta \end{bmatrix} + \eta_t, \quad \phi \in [-\pi, \pi)$$

Inverse observation model (1 landmark)

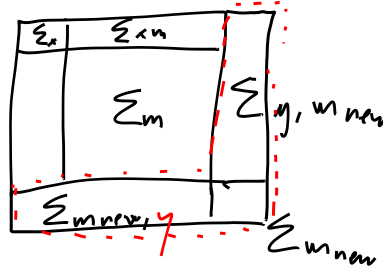

$$m_{new} = h^{-1}(z_t, \bar{y}_t) \big|_{\bar{\mu}_t} = \begin{bmatrix} \bar{\mu}_{t,x} \\ \bar{\mu}_{t,y} \end{bmatrix} + r_t \begin{bmatrix} \cos(\phi_t + \bar{\mu}_{t,\theta}) \\ \sin(\phi_t + \bar{\mu}_{t,\theta}) \end{bmatrix}$$

New landmark is expected w.r.t. robot  $m_{new} = h^{-1}(z, y)$

$$\bar{y}_t = \begin{bmatrix} \bar{y}_{t(old)} \\ m_{new} \end{bmatrix} \quad \text{We have augmented the state vector}$$

Q: and  $\bar{\Sigma}_t$ ? What is the new augmented covariance?

$h^{-1}$  non-linear  $\Rightarrow$  Covariance projection

$$h^{-1}(z_t, y_t) \approx h^{-1}(z_t, \mu_t) + L(y_t - \mu_t) + W(z_t - \hat{z}_t)$$

$$L = \frac{\partial h^{-1}}{\partial y_t} \bigg|_{\bar{\mu}_t}, \quad \text{where } \left( \frac{\partial h^{-1}}{\partial m_j} = 0 \right) \quad (\text{all Jacobians wrt landmarks are zero})$$

$$L_x = \frac{\partial h^{-1}}{\partial x_t} \bigg|_{\bar{\mu}_t^x} = \begin{bmatrix} 1 & 0 & -r_t \sin(\phi_t + \bar{\mu}_{t,\theta}) \\ 0 & 1 & r_t \cos(\phi_t + \bar{\mu}_{t,\theta}) \end{bmatrix}, \quad \text{for the case of the 2D range-bearing observation}$$

$$W = \frac{\partial h^{-1}}{\partial z} \Big|_{\bar{\mu}_t} = \begin{bmatrix} \cos(\phi_t + \bar{\mu}_{t,\theta}) & -r_t \sin(\phi_t + \bar{\mu}_{t,\theta}) \\ \sin(\phi_t + \bar{\mu}_{t,\theta}) & r_t \cos(\phi_t + \bar{\mu}_{t,\theta}) \end{bmatrix}$$

After linearizing the new landmark inverse model  $h^{-1}$ , we calculate all the covariances by the covariance propagation technique.

$$\begin{aligned} \Sigma_{m_{new}} &= E\{(m_{new} - \mu_{new})(m_{new} - \mu_{new})^T\} \\ &= E\{(L_x \Delta x_t + W \eta_t)(L_x \Delta x_t + W \eta_t)^T\} \\ &= L_x \Sigma_x L_x^T + W Q W^T, \quad \eta_t \sim \mathcal{N}(0, Q) \end{aligned}$$

$$\begin{aligned} \Sigma_{y, m_{new}} &= E\{(y_t - \mu_t)(m_{new} - \mu_{new})^T\} \\ &= E\{\Delta y (L_x \Delta x + W \eta_t)^T\} \\ &= (\text{landmarks uncorrelated with noise}) = \begin{bmatrix} \Sigma_x L_x^T \\ \Sigma_{m,x} L_x^T \end{bmatrix} \end{aligned}$$

$$\Sigma_{m_{new}, y} = L_x \cdot \begin{bmatrix} \Sigma_x \\ \Sigma_{m,x} \end{bmatrix}^T = L_x \cdot \begin{bmatrix} \Sigma_x & \Sigma_{m,x} \end{bmatrix}$$

$$\bar{\Sigma}_t = \begin{array}{|c|c|c|} \hline \bar{\Sigma}_x & \bar{\Sigma}_{x,m} & \bar{\Sigma}_x L^T \\ \hline \bar{\Sigma}_{m,x} & \bar{\Sigma}_m & \bar{\Sigma}_{m,x} L^T \\ \hline L \bar{\Sigma}_x & L \cdot \bar{\Sigma}_{x,m} & \bar{\Sigma}_{m_{new}} = L \bar{\Sigma}_x L^T + W Q W^T \\ \hline \end{array}$$

## 2.3 Correction: conditioning by observations $z_t$

$$z_t^i = h(y_t, c_t^i) + \eta_t = \begin{bmatrix} \sqrt{(m_{j,x} - x)^2 + (m_{j,y} - y)^2} \\ \text{atan2}(m_{j,y} - y, m_{j,x} - x) - \theta \end{bmatrix}, \quad c_t^i = j$$

$$h(y_t, c_t) \approx h(\bar{\mu}_t, c_t) + H \Delta y_t$$

$$\begin{aligned} H &= \frac{\partial h(y_t, c_t^i)}{\partial y_t} = \begin{bmatrix} \frac{\partial h}{\partial x_t} & \frac{\partial h}{\partial m_1} & \dots & \frac{\partial h}{\partial m_j} & \dots & \frac{\partial h}{\partial m_N} \end{bmatrix} \\ &= \begin{bmatrix} \frac{-(m_{j,x} - x)}{\sqrt{q}} & \frac{-(m_{j,y} - y)}{\sqrt{q}} & 0 & 0 & \dots & \frac{m_{j,x} - x}{\sqrt{q}} & \frac{m_{j,y} - y}{\sqrt{q}} & 0 & \dots & 0 \\ \frac{m_{j,y} - y}{q} & \frac{-(m_{j,x} - x)}{q} & -1 & 0 & \dots & \frac{-(m_{j,y} - y)}{q} & \frac{m_{j,x} - x}{q} & 0 & \dots & 0 \end{bmatrix} \end{aligned}$$

Where  $q = (m_{j,x} - x)^2 + (m_{j,y} - y)^2$

$$H = \begin{bmatrix} H_x & 0 & \dots & H_j & 0 & \dots & 0 \end{bmatrix}$$

Correction for 1 observation

## 3 Summary

Online EKF-SLAM

$$p(x_t, m | Z, U, c_t)$$

$$g(y_t, u_t) = \begin{bmatrix} g^x \\ m_1 \\ \vdots \\ m_N \end{bmatrix}, z_t = h(y_t, c_t)$$

$$H_t = \begin{bmatrix} H_x & 0 & \dots & H_j & 0 & \dots & 0 \end{bmatrix}$$

$$\bar{m}_{new} = h^{-1}(y_t, z_t) \Big|_{\bar{\mu}_t}, \mu_t = \begin{bmatrix} \mu_t \\ \mu_{m_{new}} \end{bmatrix}$$

$$\bar{\Sigma}_t = \left[ \begin{array}{c|c|c} \Sigma_x & \Sigma_{x,m} & \Sigma_x L_x^T \\ \hline \Sigma_{m,x} & \Sigma_m & \Sigma_{m,x} \cdot L_x^T \\ \hline L_x \cdot \Sigma_x & L_x \cdot \Sigma_{x,m} & L_x \Sigma_x L_x^T + W Q W^T \end{array} \right]$$
